

THE U.S. DOLLAR IS MOVING AGAIN

The dollar & global markets

A practical guide to following the forces behind price.

Start with the dollar. Investigate the system. Keep execution separate.

Three questions to bring to the charts

What changed? Why could it matter? Where is capital moving?

A connection map, not a prediction

Policy expectations can affect yields and relative asset returns. Capital can respond through currencies, commodities, and equities. Each relationship is conditional; other forces can dominate.

Then test the wider market

Gold | Equities | Oil | Currency pairs

Ask what confirms the explanation, and what contradicts it.

TGI decision lens

Macro provides context. Price supplies evidence. A predefined framework governs whether capital can be committed.

FOLLOW THE MONEY

Read the relationships

Use the same observation window across charts. Record the time, source, and timeframe before drawing a conclusion.

Dollar / DXY

Is strength broad and sustained, or a short-lived move?
An index is a basket; it does not explain every USD pair.

Treasury yields

Are nominal yields rising? What are real yields doing?
Nominal yield and inflation-adjusted yield are different.

Gold

Does price confirm the rates story, or diverge from it?
Demand, real yields, inflation, and risk can compete.

Equities / Nasdaq

Is market breadth confirming resilience or weakness?
Higher rates are one force; earnings can offset them.

Oil

Is supply, demand, or event risk driving the move?
Energy can affect inflation; the feedback is not automatic.

FX / USDCAD

What changed in both economies and rate expectations?
Relative conditions matter. A macro view is not an entry.

Divergence is a prompt to investigate. When a familiar relationship weakens, revise the explanation instead of forcing the chart to fit it.

PUT THE GUIDE TO WORK

Build a conditional view

Date / time: _____ Asset: _____

Sources: _____ Timeframes: _____

01 / Establish context

Monthly: broader context. Weekly: structure. Daily: recent behavior.

02 / Separate observation from explanation

What did price do? What is your explanation? What would contradict it?

03 / Name the decision boundary

Which framework conditions are present? What is missing? What invalidates the idea?

No authorization is a complete decision.

Compression and expansion describe behavior. Neither alone is permission to enter a trade.
